

WHY GREENWOOD?

Value Priced • Long Lasting • Minimal Maintenance

NOT ALL HDPE IS CREATED EQUAL...

On the surface they may appear similar, but a material cross section tells another story. In an effort to reduce cost, weight and density, other manufacturers *often* extrude their lumber with foaming agents, wood fiber and other "fillers." This means a potential increase in moisture absorption, material fading, reduction in recycled content, and inferior strength.

Eagle One's eco-responsible regenerative material represents a true cradle-to-cradle® lifecycle. Every ten pounds of Greenwood® repurposes 400 one gallon milk jugs, making it one of the most dense, commercial grade HDPE materials on the market.

Greenwood's® value is measured in the initial cost of material, the low maintenance burden and zero replacement cost, making it the most durable and affordable outdoor site furnishings available.

THE EAGLE ONE GREENWOOD® ADVANTAGE:

- Begins with ¾" minimum profile, which means extra heavy duty (50% more dense than the competition)
- Profiled for institutional grade outdoor use
- Uses perma-color and is UV-stabilized for minimal sun fade
- Made with dura-membrane for impact, scratch and graffiti resistance
- Maximum environmental stress resistance
- Virtually zero moisture absorption, minimizing mold, mildew and fungal growth
- Low maintenance for easy cleaning with just soap and water
- Eagle One's Greenwood® lumber is guaranteed for 25+ years for long life
